PES UNIVERSITY

CERTIFICATE

This is to certify that the mini project entitled

Coworking Space Management System

is a bonafide work carried out by

Greeshma Dhananjaiah

PES2UG23CS206

Harshita Mudliar

PES2UG23CS918

In partial fulfilment for the completion of fifth semester DBMS Project (UE23CS351A) in the Program of Study -Bachelor of Technology in Computer Science and Engineering under rules and regulations of PES University, Bengaluru during the period AUG. 2025 – DEC. 2025. It is certified that all corrections / suggestions indicated for internal assessment have been incorporated in the report. The project has been approved as it satisfies the 5th semester academic requirements in respect of project work.

Prof. Shilpa S

Assistant Professor

DECLARATION

We hereby declare that the DBMS Project entitled Coworking Space Management System has been carried out by us under the guidance of Prof. Shilpa S and submitted in partial fulfilment of the course requirements for the award of degree of Bachelor of Technology in Computer Science and Engineering of PES University, Bengaluru during the academic semester AUG – DEC 2025.

Greeshma Dhananjaiah	PES2UG23CS206	
Harshita Mudliar	PES2UG23CS918	

ACKNOWLEDGEMENT

I would like to express my gratitude to Prof. Shilpa S, Department of Computer Science and Engineering, PES University, for her continuous guidance, assistance, and encouragement throughout the development of this UE23CS351A - DBMS Project.

I take this opportunity to thank Dr. Sandesh B J, C, Professor, Chair Person, Department of Computer Science and Engineering, PES University, for all the knowledge and support I have received from the department.

I am deeply grateful to Dr. M. R. Doreswamy, Chancellor, PES University, Prof. Jawahar Doreswamy, Pro Chancellor – PES University, Dr. Suryaprasad J, Vice-Chancellor, PES University for providing to me various opportunities and enlightenment every step of the way. Finally, this DBMS Project could not have been completed without the continual support and encouragement I have received from my family and friends.

USER REQUIREMENT SECIFICATION

1. Functional Requirements

a. Client Module

- Register as a new user with unique email and phone number.
- Log in to access personal dashboard.
- View all available workspaces with capacity, price, and location.
- Create new bookings by selecting workspace and time slots.
- View personal booking history and payments.
- Choose and purchase membership plans via stored procedure.
- Update payment method (UPI, Credit/Debit Card, Net Banking, Cash).

b. Admin Module

- Log in with admin credentials.
- View all bookings (with client details, total cost, and assigned admin).
- Update booking start/end times.
- Delete invalid or duplicate bookings.
- View premium clients (nested query).
- View total revenue per admin (aggregate query).
- View total bookings made per client (aggregate query).
- Manage workspace data (capacity, type, pricing).

2. Non-Functional Requirements

- Reliability: Data integrity ensured via foreign keys and triggers.
- Performance: Optimized SQL joins and indexes for faster query execution.
- Usability: Simple Tkinter GUI for non-technical users.
- Security: Passwords stored in MySQL with unique constraints on email.
- Scalability: Supports multiple admins, clients, and workspaces dynamically.

3. Database Requirements

- A relational MySQL database named coworking_space.
- Normalized structure with 3NF compliance:
 - Client and ClientPhone for multivalued attributes.
 - Booking, Payment, Workspace, and Admin for relationships.
 - MembershipPlan and MembershipBenefit for memberships.

- Use of triggers, procedures, and functions for automation.

List of Software Tools/ Programming Languages used:

- Python
- MySQL
- Tkinter
- Draw.io (For ER Diagram)
- VSCode

1. INTRODUCTION

The Coworking Space Management System is a database-driven desktop application designed to streamline the management of shared office spaces.

The system provides a user-friendly Tkinter-based GUI frontend connected to a MySQL database, ensuring smooth interaction between clients and administrators.

Clients can register, view available workspaces, book slots, make payments, and subscribe to Membership plans. Administrators can monitor bookings, update or delete records, track revenue, and analyze workspace usage.

This project implements key DBMS concepts such as:

- Triggers for automating total cost and payment insertion.
- Stored Procedures for managing memberships.
- Stored Functions for computing total client spending.
- Nested and Aggregate Queries for analytical reporting.

The application ensures data consistency, integrity, and automation, demonstrating a fully integrated database management solution using Python and MySQL.

2. PROBLEM DEFINITION

In recent years, the demand for **coworking spaces** has grown significantly due to flexible working patterns, freelancing, and startup culture.

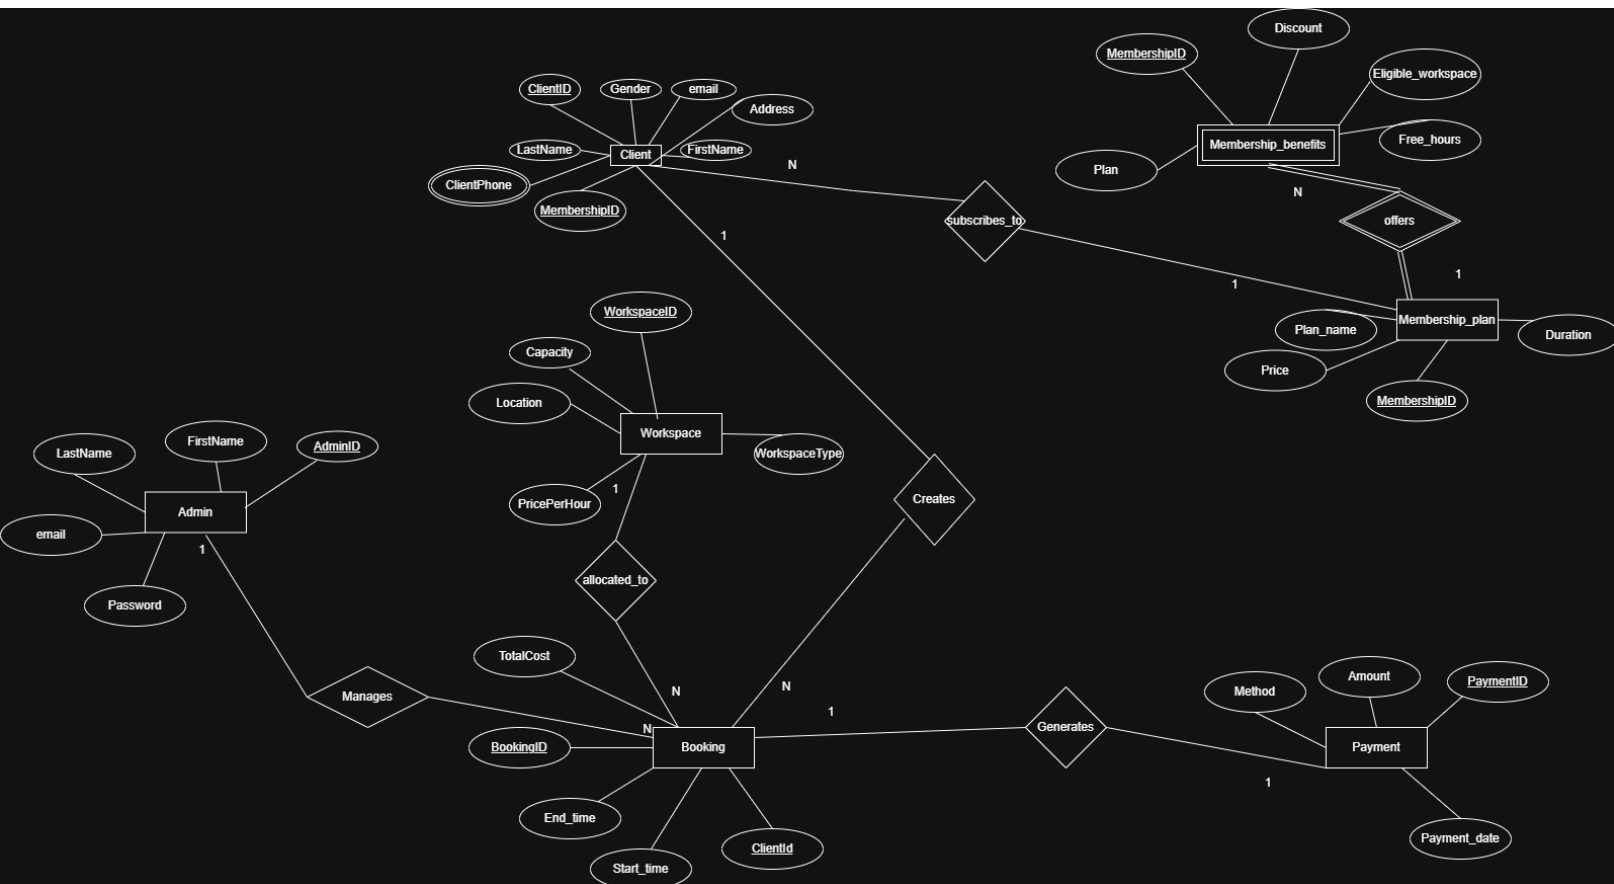

Managing such shared workspaces manually often leads to inefficiencies — including **overlapping bookings, incorrect billing, inconsistent data entry, and lack of centralized monitoring**.

To address these challenges, the **Coworking Space Management System** aims to design and implement a **database-driven application** that provides an integrated solution for both **administrators** and **clients**.

The system allows:

- **Clients** to register, browse available workspaces, create bookings, make payments, and manage memberships easily through a simple GUI.
- **Administrators** to manage bookings, monitor payments, update workspace information, and analyze revenue or usage patterns efficiently

ER MODEL

3. ER TO RELATIONAL MAPPING

The conceptual ER model was converted into a physical, relational schema (a set of tables for MySQL) using standard mapping algorithms:

1. Map Strong Entities: Each strong entity (e.g., Client, Admin, Workspace, Membership_plan, and Payment) is mapped to its own table. The entity's attributes become the table's columns, and a primary key is chosen (e.g., ClientID, AdminID, WorkspaceID, MembershipID, PaymentID).
2. Map Weak Entities: The weak entity Membership_benefits (shown with a double-lined box) is mapped to its own table, MembershipBenefit. This table includes a foreign key, MembershipID, which links it to its owner entity table, MembershipPlan.
3. Map 1:N (One-to-Many) Relationships: These relationships are implemented by adding the primary key of the 'one' side as a foreign key into the table of the 'many' side.
 - Admin (1) Manages (N) Booking: The AdminID (from Admin) is added as a foreign key to the Booking table.
 - Client (1) Creates (N) Booking: The ClientID (from Client) is added as a foreign key to the Booking table.
 - Workspace (1) allocated_to (N) Booking: The WorkspaceID (from Workspace) is added as a foreign key to the Booking table.
 - Membership_plan (1) has (N) Client: This is the subscribes_to relationship. The MembershipID (from MembershipPlan) is added as a foreign key to the Client table.
4. Map 1:1 (One-to-One) Relationships: The 1:1 relationship, Booking (1) Generates (1) Payment, is implemented by adding the primary key of one side (BookingID) as a foreign key into the other side's table (Payment).
5. Map M:N (Many-to-Many) Relationships: In this schema, the central M:N interaction between clients and workspaces is resolved by modeling it as a strong entity.
 - The Booking entity itself acts as an associative table. It links Client and Workspace (and also Admin) by containing the foreign keys ClientID, WorkspaceID, and AdminID.
6. Map Attributes:
 - Composite Attributes: Attributes like Name for Client and Admin in the conceptual model are broken down into simple, atomic attributes (FirstName, LastName) in the physical tables.
 - Multivalued Attributes: The ClientPhone attribute (shown with a double oval in the ER diagram) is mapped to its own separate table, ClientPhone. This table contains PhoneNumber and the foreign key ClientID to link multiple phone numbers to a single client.

4.1 STEPS OF ALGORITHM FOR CHOOSEN PROBLEM

The **Coworking Space Management System** operates through structured database-driven workflows.

The main steps for each module are summarized below:

1. Login / Signup

1. Start the application.
2. User enters login credentials.
3. If new user → open signup form and insert details into Client and ClientPhone tables.
4. Validate credentials:
 - If admin → open admin dashboard.
 - If client → open client dashboard.

2. Booking Creation

1. Client selects a workspace, start time, and end time.
2. System checks for overlapping bookings.
3. Assigns next admin automatically using AdminAssignmentTracker.
4. Inserts record into Booking.
5. **Trigger 1:** Calculates total cost.
6. **Trigger 2:** Inserts payment record.
7. Displays confirmation and opens payment page.

3. Payment Confirmation

1. Fetch recent payment details from Payment table.
2. Display amount, payment ID, and date.
3. Allow user to select or update payment method.
4. Update method in database and confirm transaction.

4. Membership Management

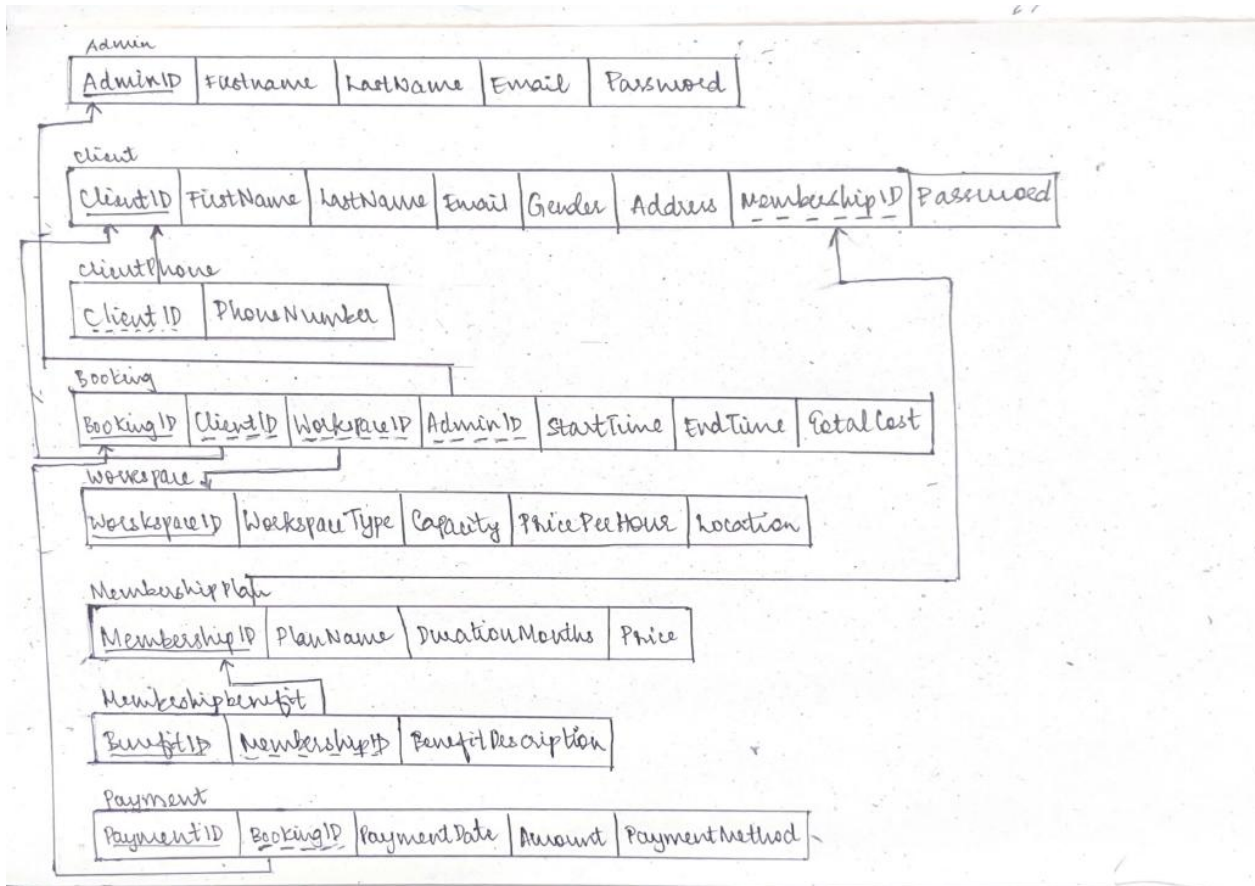

1. Display all membership plans and benefits.
2. On selection, call stored procedure PurchaseMembership(ClientID, PlanID).
3. Update client's membership status.

5. Admin Operations

1. Admin views all bookings with client and workspace details.
2. Can update or delete bookings as needed.
3. Uses aggregate and nested queries to view:
 - Premium clients
 - Total revenue per admin

- Total bookings per client

4.2 COMPLETE DIAGRAM OF RELATIONAL MAPPING

4. DDL STATEMENTS

The screenshot displays the MySQL Workbench interface with the 'coworking_space' database selected. The left sidebar shows a list of schemas, including 'airlines_db', 'company', 'coworking_space', 'fest_database', 'isolation_demo', 'new_company', 'sys', 'university_db', 'university_fest', and 'universityfest'. The main editor window shows the following SQL statements:

```
1  -- DATABASE: coworking_space
2  -- =====
3  --
4  * CREATE DATABASE IF NOT EXISTS coworking_space;
5  * USE coworking_space;
6  --
7  -- =====
8  -- 1. ADMIN TABLE
9  -- =====
10 * CREATE TABLE Admin (
11   AdminID INT AUTO_INCREMENT PRIMARY KEY,
12   FirstName VARCHAR(50),
13   LastName VARCHAR(50),
14   Email VARCHAR(100) UNIQUE,
15   Password VARCHAR(50),
16   PhoneNumber VARCHAR(15)
17 );
18 --
19 -- =====
20 -- 2. CLIENT TABLE
21 -- =====
22 * CREATE TABLE Client (
23   ClientID INT AUTO_INCREMENT PRIMARY KEY,
24   FirstName VARCHAR(50),
25   LastName VARCHAR(50),
26   Email VARCHAR(100) UNIQUE,
27   Password VARCHAR(50),
28   Gender ENUM('Male', 'Female'),
29   Address VARCHAR(200),
30 );
31 --
32 -- =====
33 -- 3. CLIENT PHONE (MULTI-VALUE ATTRIBUTE)
34 -- =====
35 * CREATE TABLE ClientPhone (
36   PhoneNumber VARCHAR(15) PRIMARY KEY,

9.FRONT END DEVELOPEMNT

The screenshot displays a web application interface. On the left, a modal window titled 'Client Sign Up' is open, showing a 'New User Registration' form. The form includes fields for First Name (Ritu), Last Name (M), Email (Ritu@example.com), Password (masked with asterisks), Gender (Female), Address (Banerghatta), and Phone Number (8576948574). A green 'Sign Up' button is at the bottom. On the right, the main 'Coworking Space Login' window is visible, featuring fields for Email and Password, and buttons for 'Login' (green) and 'Sign Up' (blue).

This screenshot shows the 'Coworking Space Login' page. It has a dark green header bar. Below it, the title 'Coworking Space Login' is centered. The login form consists of an 'Email:' label followed by a text input containing 'ritu@example.com', and a 'Password:' label followed by a text input containing '*****'. Below the inputs are two buttons: a green 'Login' button and a blue 'Sign Up' button.
